Manual Version 1.0.0

Product Version 1.0.0

01

Getting started

A VST3 plug-in that you load onto a track in your DAW.

A countdown timer that helps you keep track of a work session.

- 1 Find N.Timer in your DAW's plug-in list and load it onto the track you want to use.
- 2 Open the plug-in window using your DAW. Turn on Pin in the header if you want the window to stay open.
- 3 Save your DAW project after making changes. Settings restored from a project take priority over shared defaults.

In this manual

Page	Contents
3	Set a duration and start
4	Notification sounds and keyboard controls
5-6	Shared NINZYA controls and Settings
7	VST edition notes and troubleshooting

Pages 5 and 6 translate the supplied Converter manual while retaining its layout and Converter heading. See page 7 for details that apply to this product.

This manual covers VST3 version 1.0.0. Product-specific instructions are based on the documentation and source for the included plug-in.

02

Set a duration and start

Set any duration up to 99 hours, 59 minutes and 59 seconds.

Volume

Mute

Layout guide; the actual appearance may vary.

- 1

Enter digits in HOURS, MINUTES and SECONDS. For five minutes, enter 00, 05 and 00.
- 2

Press Start to begin. Press Pause to pause, then Resume to continue.
- 3

Press Reset to return to the last configured duration.

Status	Meaning
READY	Ready to start. You can edit the duration.
RUNNING	The countdown is running.
PAUSED	The countdown is paused.
COMPLETED	The remaining time has reached zero.

The initial duration is 25 minutes. Time fields cannot be edited while running or paused. The countdown continues in Ghost while the plug-in remains loaded.

03

Sounds and keyboard controls

Use Preview to hear the completion sound.

Control	How it works
Notification	Choose Bell, Chime, Digital, Beep or Soft.
Preview	Plays a preview of the selected sound.
Volume	Adjusts the notification level from 0% to 100%.
Mute	Silences both completion sounds and Preview.

The VST version adds the notification sound to the track's audio output. Enable Mute if you do not want notifications included in a recording or export.

Key	Action
0-9	Enter digits in the selected time field.
Enter / Return	Start the countdown.
Space	Start, pause or resume.
Esc	Reset to the configured duration.

Keyboard controls work when the plug-in receives the keystrokes. If a key has no effect, use the on-screen button.

Closing the editor and reopening a project

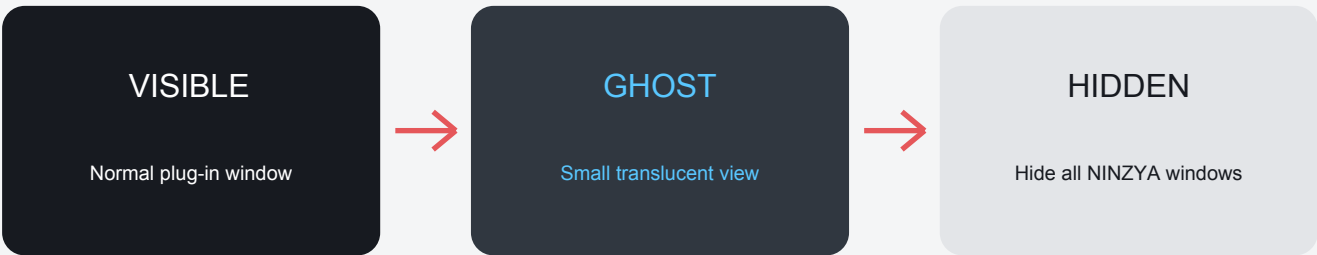

The countdown runs in the plug-in, independently of the editor. It continues in Ghost or with the editor closed while the plug-in remains loaded. Reopening a project restores the configured duration, not an active countdown.

04

Using NINZYA

Show plug-in windows only when you need them.

Opening a plug-in shows its normal window. Move the pointer away to shrink it to a small Ghost. Move the pointer back onto the Ghost to restore the normal window.

Action	Result
Move the pointer away	Switches to a small Ghost.
Point to the Ghost	Restores the normal plug-in window.
Pin	Keeps the plug-in window open.
Gear	Opens Settings in the same window.
Drag	Moves the normal plug-in window.
Shift + drag the Ghost	Moves the Ghost and saves its position.

While you use the original plug-in's preset window or another child window, NINZYA prevents the main window from switching to Ghost unexpectedly.

There is no close X inside NINZYA. Use the DAW's window controls to close the plug-in window.

05

Settings

Adjust the Ghost appearance and behavior for each instance.

Setting	Range / meaning
Ghost Label	Uses the VST plug-in name by default, not the track name.
Ghost Scale	Adjusts the size of the Ghost.
Border Width	Sets the border thickness.
Label Font Size	Sets the Ghost label text size.
Color Saturation	Adjusts the saturation of the track color.
Color Brightness	Adjusts the brightness of the track color.
Border / Label	Shows the border and label. Both cannot be off at the same time.
Animation	Animates transitions between Visible and Ghost.
Dark Theme	Switches the entire interface to a dark appearance.
Reset Baseline	Restores the basic appearance settings to their defaults.

All settings are restored on reopening. Project-specific state supplied by the DAW takes priority.

The track color is applied to the Ghost border and label. The Ghost displays the VST plug-in name.

06

VST notes and troubleshooting

Read this page alongside the shared pages 5 and 6.

Item	This VST edition
Ghost Label	The label is N.Timer, not the track name.
Settings	Click the gear to open Settings; click again to return. The border uses the track color supplied by the DAW.
Reset Baseline	Described on shared page 6, but this button is not present in the reviewed 1.0.0 Settings screen.
All Hidden	On macOS, Cmd + Option + Shift + H hides all NINZYA windows; press again to restore them. There is no ALL HIDDEN button in Settings.

The preset/child-window protection on page 5 is part of the shared Converter text; it does not imply that this product has a preset browser.

Troubleshooting

Issue	What to check
No notification sound	Check Mute, Volume, the track mute, level and routing, and the DAW audio engine. Then press Preview.
Cannot edit the time	Time fields are disabled while running or paused. Press Reset to return to READY.
Window shrinks	Enable Pin to keep the normal window open.
Cannot move Ghost	Hold Shift throughout the drag.

Scope and sources

Product-specific instructions: NINZYA Utilities for Live 1.0.0 README and product/common source files. The existing Timer Japanese Manual 1.0.0 supplies the basic feature descriptions; VST-specific controls, state and audio behavior follow the source.

Shared pages 5-6: translated from physical pages 5-6 of NINZYA Converter Japanese Manual 1.0.0. Manual revision 1.0.0 / 2026-09-10.
